Ms. Gen-Gen Roma

1. Session

Meaning: A session is a temporary way for a website to remember your information while you move from one page to another. It keeps track of things like whether you're logged in or what items you added to your cart, but only until you close the browser or log out.

Example: You log in to an online store, browse several pages, the site still knows it's you. That's the session working.

2. Cookie

Meaning: A cookie is a small file stored in your browser that helps websites remember things even after you close the page. It can save preferences, login info, or tracking details so the site can recognize you next time.

Example: You click "Remember me" on a login form, next time the site logs you in automatically. The cookie stored your login info.

3. Authentication

Meaning: Authentication is the process of verifying your identity before giving you access. It checks if you really are the person you claim to be, usually through passwords, codes, or fingerprints.

Example: When you enter your username and password to access your email, the system checks if they are correct, that's authentication.

4. RESTful

Meaning: RESTful refers to a style of designing APIs where clients and servers communicate using simple rules and standard HTTP methods like GET, POST, PUT, or DELETE. It makes it easy for different systems to exchange data.

Example: When an app wants a list of users and sends GET /users, it's using a RESTful request to get that data from the server.

5. API

Meaning: An API (Application Programming Interface) is a set of rules that lets one program communicate with another. It decides what data can be requested, how to request it, and what response you'll get.

Example: A weather app doesn't measure the weather itself; it asks a weather service through an API, and the API sends back the temperature and forecast.
