JavaScript Number Guessing Game Activity 2

The Number Guessing Game

The computer secretly chooses a random number between 1 and 100. The player does not know the number and must try to guess it.

The player gets up to 5 chances to guess. Each time the player enters a number, the computer checks the guess and gives feedback. If the guess is higher than the secret number, the computer says, "Too high." If the guess is lower than the secret number, the computer says, "Too low." If the guess matches the secret number, the computer says "Correct" and the game ends.

If the player uses all 5 guesses without finding the correct number, the game ends and the computer reveals what the secret number was.

The goal of the game is to guess the number in as few tries as possible by using the clues "too high" or "too low" to get closer each time.
